

Using Mail plugin

In this lab, we will use Mail activities. To check whether the Mail package is installed or not, simply search for `Mail` in the **Activities** panel. It will list all the mail activities. If the activities are not listed in the **Activities** panel then you have to install the `UiPath.Mail.Activities` package.

To install the Mail NuGet package, click on the **Manage Package** icon at the top of the **Activity** panel. The **Manage Packages** window will appear. Search for `mail` in the search bar. As shown in the following screenshot, there is an **Uninstall** button next to `UiPath.Mail.Activities`. This is because the Mail activity is already installed in UiPath Studio. If it is not installed, an **Install** button will appear next to the `UiPath.Mail.Activities`:

There are various mail activities that are used when working with UiPath Studio:

Lab Solutions

Lab solution(s) are present in `Solution\Lab11` folder.

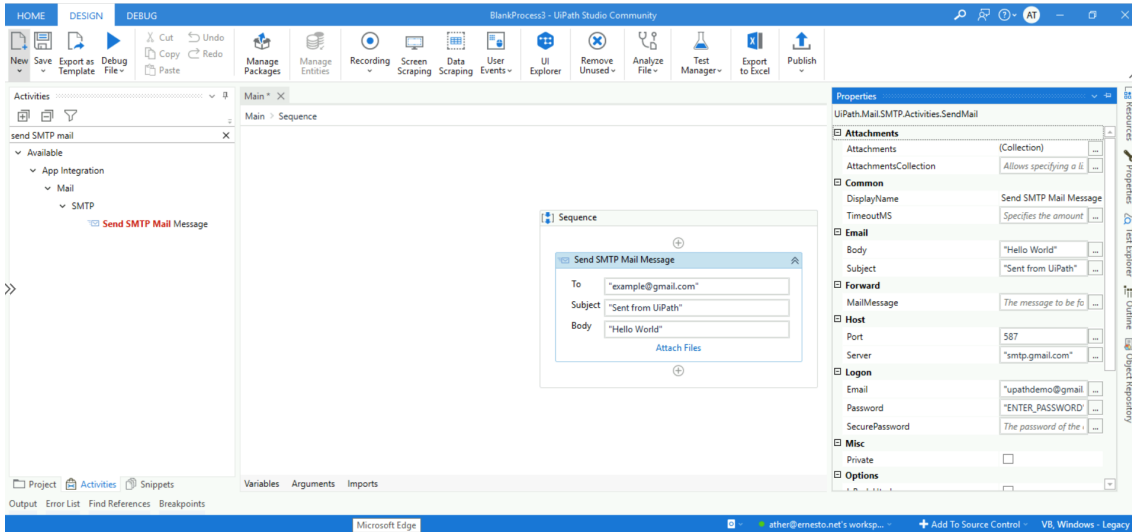

In this lab, we will send email using following activity:

SMTP: It is used to send mail messages: - **Send SMTP Mail messages** activity: This activity is used to send a mail to another mail.

Steps:

1. Create a blank process and add above activity
2. Enter all details as shown in below screenshot:

Gmail SMTP Server: "smtp.gmail.com"
SMTP port: 587
SMTP username: "upathdemo@gmail.com"
SMTP password: "Robotics2021@"

3. You can use you email and run the activity. Verify that email is received in you inbox.
